L. Avenue

The water sculpture is comprised of two curved copper structures with bronze patina. The taller structure is 12 ft. tall and the shorter structure is 3 ft. tall. The concave surfaces of the sculptures are textured and the convex surfaces are smooth, each creating a different water effect. A column of rain falls inside the taller structure and both disappear into a recessed stainless steel basin, covered with river rock, and illuminated by a series of underwater lights.

Type
Water sculpture with rain curtain in a courtyard

Materials
ridged and smooth copper with bronze patina

Location
City of Industry, CA
