

Tribeca West

This free-standing water feature consists of four, six ft. wide glass panels that overlap to create an eighteen ft. wide water wall that becomes the focal point of the newly remodeled office complex. The innovative structural design allows the frameless glass panels to be suspended with minimal structural frame. Extensive engineering and testing were conducted to build a structurally sound water feature that can withstand the strong wind loads and also meets local building codes. In front of the water wall (facing the lounge area) a low-height textured stone water feature continually overflows to create a reflecting pool with the soft sound of falling water.

Type

Glass water wall and stone feature in an exterior lounge

Materials

glass, stone

Location

West Los Angeles, CA

Architect

Aref & Associates
